#PSXi - A Pode and PSHTML Service for VMware, Hyper-V, PesterTests and HPE OneView Services

Current Situation

ScriptRunner runs scheduled PowerShell-Scripts to collect all the data of all vCenters, VMMServer, PesterTests, HPE OneView and send it over WinRM as CSV/JSON-files to the

Pode-Server. The Pode-Server has a FileWatcher where it check for new CSV/JSON-files in /uploads and execute a PSHTML-script that creates the web-pages.

SQLite Feature

All the CSV/JSON-files should be imported in to a SQLite DB.

Aria Orchestrator

As soon as the Classic has disappeared, i would replace the ScriptRunner scripts of all VMware tasks with Aria Orchestrator Workflows.

The screenshot shows the #PSXi Home Page with a dark blue header containing the title "#PSXi Home Page" and a note: "The child-pages will automatically updated from Monday to Friday at 07:30 AM". Below the header is a navigation bar with links: »HOME, Grafana, ScriptRunner, GitLab, LPAR2RRD, HPE Servers Support & OS Certification Matrices. The main content area is a grid of 16 cards arranged in two rows of eight. The first row contains cards for Compute, VMware, HPEOneView, Hyper-V, Cloud VMware, Cloud VMware, Cloud VMware, and Cloud VMware. The second row contains cards for Cloud VMware, Cloud VMware, Classic, Classic, Classic, Classic, Classic, and Classic VMware. Each card displays its name, a brief description, and a button for further action (e.g., Diagram, vCenter, Inventory, Results, Diagram, Inventory, Datastore, Network). At the bottom of the page are footer links (I ❤️ PS >), a note about the base technologies (Based on PSXiDiag, PSHTML and Pode), and a timestamp (Last update 21.06.2024 16:34:41).

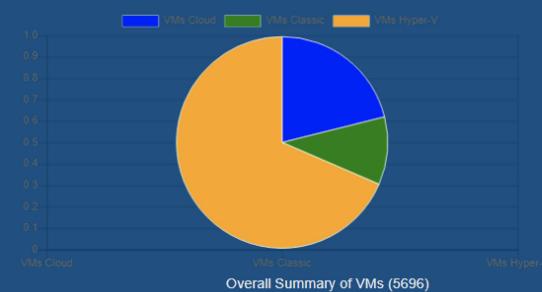

This is the Homepage of the PSXi App. It shows you all the pages that can be viewed.
